Special Exception Permit Application 03/01/2019

PROJECT NARRATIVE: PROPOSED SITE DEVELOPMENT 467 & 485 Pepper Street – Monroe, Connecticut

This Special Exception Permit Application is for the proposed site development activities located at 467 & 485 Pepper Street. 467 & 485 Pepper Street consist of 10.26 acres and are owned by 485 Pepper Street, LLC. The subject site is zoned Industrial District 1 (I-1) and has received various approvals from the Monroe Planning & Zoning and Inland Wetlands Commission over the past several years. The following summarizes the project and the work being completed within the regulated area.

Current Application:

The current application put forth before the commission includes the construction of a $9,000\pm$ SF material processing building and associated driveways, parking, outdoor storage areas, utility connections and landscaping.

The site is currently accessed via Pepper Street, with a gravel drive extending into the property. There is an existing building and associated construction equipment on 485 Pepper Street. 467 Pepper Street is an existing residence and garage which will be removed as part of the project. There are two wetland areas on the site, located down gradient to the southwest. The wetlands of 485 Pepper Street were originally flagged in February & April 2018 by JMM Wetland Consulting services. In June of 2022, JMM Wetlands visited both sites and flagged the wetlands located on 467 Pepper Street. The location of all wetland flags is shown on the Site Plans submitted as part of this application.

The project proposed to maintain the existing $1,795\pm$ SF office building and construct a $9,000\pm$ SF material processing building. The plans call for $56,853\pm$ SF of outdoor storage, located within 12 storage bins and three pre-defined storage areas. The outdoor storage areas will be used for aggregate material, construction material, and construction equipment storage. All outdoor aggregate storage bins will feature sprinklers mounted on top of concrete blocks for dust control. The site previously received approval for an indoor crushing/screening facility and this application will follow the same plan, as the crushing will take place within the new 9,000 SF enclosed building. There will be 15 parking spaces, including 2 handicap parking spaces. There will also be one designated loading space. There will be two site access drives, located at the northern portion of 485 Pepper Street and the southern portion of 467 Pepper Street, respectively. Truck traffic will be restricted to exit only through the 467 Pepper Street site drive due to sight distance restrictions within the 485 Pepper Street exit. There will be a permanent truck scale and associated construction trailer/scale house to track incoming and outgoing materials.

The previously approved application featured a $4,064 \pm$ SF enclosed crushing and screening facility, with 8 outdoor storage bins. The current application features a 9,000 SF enclosed crushing and screening facility, with 12 outdoor storage bins. The previously approved application also featured an approximate processing & sorting area of approximately 45,000 SF, in comparison with the approximately 124,000 SF put forth in this application. The applicant purchased the property of 467 Pepper Street in order to provide more room for the operation.

The proposed metal building has been designed to house a series of crushing and screening machines. Conveyor belts, that fold in when not in use, protrude from inside the building walls outside through garage style doors and form product piles outside of the structure. to be picked up by transport equipment into the storage bins previously mentioned. Please refer to the architectural plans for more details on this metal structure.

In the rear of the site is a series of concrete and boulder retaining walls, protecting the existing wetlands from future disturbance. An outdoor storage area in the rear of the site is accessed via an existing gravel drive. While a significant portion of the site is to be paved, the majority of the work area will be finished with asphalt millings.

There will be no direct wetland impact as a result of this project, and significant buffer plantings have been provided between the wetlands and limit of work. Additional landscape screening and buffer plantings have been provided within both the front and rear setbacks.

In order to reduce and treat stormwater runoff, three stormwater basins and one underground detention system have been designed on the site plans. The site access drive located within 467 Pepper Street will include a permanent anti-tracking pad in the form of wide-grooved concrete pavement, which will direct runoff through a paved leak off to a permanent sedimentation basin. This will help prevent tracking onto Pepper Street.

The subsurface sewage disposal system, designed and approved under the previous application, will be installed as part of the proposed project. The proposed project proposes a subsurface sewage disposal system, consisting of a septic tank, distribution box, and leaching galleries, that will adequately handle the proposed capacity without any breakout of backflow.

Water, electric, cable, and telephone are available within Pepper Street. This project proposes to maintain the existing propane tanks and pipe configuration located behind the exiting building. The enclosed crushing building, as well as all the outdoor storage bins will be equipped with dust control sprinklers. See the Civil Plan Set and Engineering Report for more detailed information.

If the project were to receive all the necessary approvals, a Lot Consolidation Plan will be filed on the land records, creating one lot as shown on the Site Plans.

INTRODUCTION

Solli Engineering has prepared this engineering report to provide an analysis of the stormwater drainage, utilities and soil erosion and sediment control measures associated with the development of an industrial facility at 467 & 485 Pepper Street, Monroe, Connecticut. The design has been completed in compliance with all applicable Town of Monroe codes and regulations as well as all other applicable state and federal requirements.

PROJECT DESCRIPTION

EXISTING CONDITIONS

The site is located at 467 & 485 Pepper Street in Monroe, Connecticut. The overall site totals approximately 10.26 acres and is bounded by Pepper Street to the east, the Housatonic Valley Rail Trail to the west, residential development to the south, and industrial development to the north. The site is currently accessed from Pepper Street via a gravel driveway.

The site is currently developed with two 1.5-story wood framed building, covering approximately 1,750 square feet, with associated gravel drives and parking areas on 485 Pepper Street, with an existing residence, garage and associated paved driveway at 467 Pepper Street. Behind the existing residence and to the rear of 467 Pepper Street is wooded and undeveloped. 485 Pepper Street has been previously developed and is currently operational, with the majority of the site disturbed. Wetlands exist on both properties in the southwestern portion of the sites. Refer to the Property Survey (Sheet 1 of 1), in the accompanying Plan Set for more information regarding the existing site conditions.

The site consists of approximately 1.21 acres of wetland area and approximately 2.96 acres of upland review area (See Appendix A, Figure 5, Regulated Area Map). The wetlands were delineated and flagged by JMM Wetland Consulting Services LLC on February 24, 2018, in accordance with the Connecticut State Statutes (CGS Sections 22a-36 to 22a-45). An additional site visit was conducted on April 11, 2018. The wetlands on 485 Pepper Street were also revisited and the wetlands of 467 Pepper Street flagged on June 1, 2022. Refer to the Site Investigation Report, prepared by JMM Wetland Consulting Services LLC for more information regarding the existing on-site wetlands and vernal pool.

According to the map entitled "Aquarion Water Company Public Drinking Water Supply Watershed Area; Monroe, Connecticut," the property is located within the West Pequonnock Public Drinking Water Supply Watershed. Aquarion Water Company has been notified of this application and proposed site work.

According to FEMA Flood Insurance Rate Map, Map Numbers 09001C0257F, 09001C0259F, 09001C0276F and 09001C0278F, the project site is not within a special flood hazard area subject to inundation by the 1% annual chance flood (100-year flood), also known as the base flood. (See Appendix A, Figure 2, FEMA Flood Map)

PROPOSED CONDITIONS

The project proposes to maintain the existing $1,795\pm$ square-foot building within 485 Pepper Street and construct an enclosed, $9,000\pm$ square-foot, crushing and screening processing building within 467 Pepper Street, with associated drives, parking areas, utilities and drainage features. The proposed operations will also consist of 12 outdoor storage bins, and three outdoor storage areas, providing a total of $56,853\pm$ square foot of outdoor storage.

The proposed development includes two driveway accessways providing access from Pepper Street. The proposed layout provides 15 total parking spaces; of which two are ADA accessible spaces. Trucks and construction vehicles will enter the site via Pepper Street and travel around the rear of the existing building to access the surge pile and stone crushing area. Trucks will access the proposed truck scale after loading/unloading and navigate to the southern proposed drive on 467 Pepper Street to exit.

The proposed development results in an increase in impervious area of approximately $3.57\pm$ acres when compared to existing conditions. To attenuate the peak flows produced by the increase in impervious area the project has been designed with one sub-surface detention system, located at the center of the project site. The underground detention system is comprised of Cultec stormwater chambers, with associated catch basin, drainage pipes, pretreatment facilities and outlet protection. There are also three stormwater basins, including two water quality basins, proposed on site. Refer to the *Stormwater Management* section of this report for more details regarding the proposed drainage system.

The project proposes a subsurface sewage disposal system, consisting of a septic tank, distribution box, and leaching galleries, that will adequately handle the proposed capacity without breakouts or backflow. Refer to the *Septic System Design* section of this report for more details regarding the proposed system.

STORMWATER MANAGEMENT

As the Town of Monroe Zoning Regulations do not provide stormwater guidelines, the stormwater management plan and design for the proposed industrial facility is intended to be in compliance with portions of the Town of Monroe Subdivision of Land Regulations Article III, Section 111-302, the 2004 Connecticut Stormwater Quality Manual and the CTDOT 2000 Drainage Manual, while taking prevailing site conditions and practical considerations into account.

METHODOLOGY

Stormwater runoff analysis, for both existing and proposed conditions, was performed using the software package Civil 3D 2022 Hydraflow Hydrograph Extension. This software uses a computer implementation of the SCS – TR-55 methodology to compute volumes and rates of runoff. The watershed area, rainfall depths and intensity, curve number and time of concentration are factors that influence the computed results.

Rainfall depths for this property were used for calculating the volumes and rates of runoff for this particular project. The depths were taken from the NOAA Atlas 14 documents (Latitude: 41.3456°, Longitude: -73.2509°) and are listed in Table 1 below.

Return Period	24-hr Rainfall Depth (in)
2-year	3.59
5-year	4.67
10-year	5.57
25-year	6.80
50-year	7.72
100-year	8.71

Hydraflow Hydrographs Extension automatically computes the rainfall intensity from its own IDF curves when the rainfall intensity data is provided. Table 2 shows the data that was used to generate the IDF

curves. This information was taken from the from the NOAA Atlas 14 documents (Latitude: 41.3456°, Longitude: -73.2509°) and are listed in Table 2 below.

T 11

SCS uses the runoff curve number (CN) method to estimate runoff from storm rainfall. The major factors that determine CN are the watershed's soil and cover conditions, cover type, treatment and hydrologic condition. The higher percentage of impervious cover within a watershed will result in a higher curve number. A composite curve number was calculated for each analyzed watershed. Refer to Appendix B for the calculations used in determining the existing and proposed curve numbers, for the individual drainage areas.

The time of concentration is the time it takes for runoff to travel from the hydraulically most distant point of the watershed to a point of interest within the watershed. The time of concentration is calculated by adding the travel times of sheet flow, shallow concentrated flow and open channel flow, or some combination of these depending of the watershed and its features. Refer to Appendix B for the calculations used in determining the existing and proposed time of concentrations, for the individual drainage areas.

EXISTING HYDROLOGY

Slopes on site range from approximately 1.5 percent to 30 percent, with a high elevation of approximately 438 feet and a low elevation of approximate 406 feet within the wetlands to the north. According to the NRCS Soil Survey Geographic database for the State of Connecticut, the majority of the site in which the project is proposed is comprised of Canton and Charlton. This soil type has a hydrologic soil group rating of B. A breakdown of all the soils, located within the property limits, as well as the NRCS Soil Survey Map for the site can be found in Appendix A, Figure 3.

Approximately 9.05 acres (project area) of the 10.26-acre site was analyzed for stormwater management purposes. This portion of the site evaluated contains the contributing areas directly impacted by the development. Based on existing drainage patterns, the 10.26-acre area was divided into four (4) contributing drainage areas, labeled Drainage Area EDA-1, Drainage Area EDA-2, Drainage Area EDA-3, and Drainage Area EDA-4. The approximate location and delineation of these drainage areas can be seen on Sheet DA-1, Existing Drainage Area Map, found in Appendix B. Existing conditions within 485 Pepper Street were evaluated prior to site disturbance.

EDA-1 has a contributing area of approximately 5.67 acres. The area is occupied by a gravel lot, woods in good conditions, and impervious coverage. This area encompasses the central portion of the project area. The majority of runoff from EDA-1 flows into the existing wetland to the west of the property.

EDA-2 has a contributing area of approximately 0.49 acres. The area is occupied by open space in poor condition, gravel access drive and parking area. Runoff from EDA-2 travels east onto Pepper Street located to the east of the property.

EDA-3 has a contributing area of approximately 2.26 acres. The area is occupied by woods in good conditions, open space in good condition, and impervious cover from the roofs and paved driveway. This area encompasses the southeastern portion of the project area. Runoff from EDA-3 travels east onto Pepper Street located to the east of the property.

EDA-4 has a contributing area of approximately 0.63 acres. The area is occupied by woods in good conditions. This area encompasses the southwestern portion of the project area. Runoff from EDA-4 travels southwest, overland, towards the neighboring property to the south.

Characteristics of these drainage areas are summarized in Table 3. A map depicting existing drainage areas and their characteristics, entitled "Existing Drainage Area Map (EDA-1)", can be found in Appendix B.

PROPOSED HYROLOGY & HYDRAULICS

The proposed development consists of drainage areas that are of similar patterns to existing contributing areas, within the 9.05± acres analyzed. Based on the proposed drainage patterns, the 9.05-acre area was divided into seven (7) contributing drainage areas, labeled Drainage Area PDA-1A, Drainage Area PDA-1B, Drainage Area PDA 1C, Drainage Area PDA 1D, Drainage Area PDA-2, Drainage Area PDA-3A, Drainage Area PDA-3B, and Drainage Area PDA-4. The approximate location and delineation of these drainage areas can be seen on Sheet PDA-1, Drainage Area Map, found in Appendix B.

PDA-1A has a contributing area of approximately 1.93 acres. The area is occupied by herbaceous ground cover and consists of Group B and Group D soil. The runoff from PDA-1A flows overland into the existing wetland to the southwest of the property.

PDA-1B has a contributing area of approximately 3.41 acres. This area is comprised of southern portion of the proposed development area. Runoff from PDA-1B will travel over asphalt millings into the proposed stormwater conveyance system, which conveys runoff into a hydrodynamic separator before entering the stormwater detention basin. The basin discharges into the existing wetlands to the west of the property via a level spreader.

PDA-1C has a contributing area of approximately 0.91 acres. The area will be occupied by herbaceous ground cover in good condition. This area also features the gravel outdoor storage area. Runoff from PDA-1C travels southwest, overland, into the proposed stormwater detention basin. The basin discharges into the existing wetlands located to the west of the property via a level spreader.

PDA-1D has a contributing area of approximately 1.30 acres. This area is comprised of the construction yard within 485 Pepper Street. Runoff from PDA-1D travels, overland, into a proposed stormwater conveyance system and is routed through a hydrodynamic separator prior to entering an underground detention system. The system attenuates the runoff then discharges into the stormwater basin in the southwest corner of the property.

PDA-2 has a contributing area of approximately 0.27 acres. The area is occupied by herbaceous ground cover, an existing 1,795 SF building, and paved a driveway. This area encompasses the northeast portion of the project area. Runoff from PDA-2 travels east, overland, onto Pepper Street.

PDA-3A has a contributing area of approximately 0.39 acres. This area is comprised of the front portion of the 467 Pepper Street, site drive and a portion of the construction yard within 467 Pepper Street. Runoff from PDA-3A travels east, overland, into a stormwater basin before out letting through a riser to a riprap splash pad. This runoff then discharges into a culvert beneath Pepper Street.

PDA-3B has a contributing area of approximately 0.63 acres. This area is comprised of the front portion of the 467 Pepper Street and the front of the southern portion of 485 Pepper Street along the property. Runoff from PDA-3B travels east, overland, into a culvert beneath Pepper Street.

PDA-4 has a contributing area of approximately 0.21 acres. The area is occupied by open space in good conditions with herbaceous ground cover. This area encompasses the southern portion of the site. Runoff from PDA-4 travels southwest, overland, onto the neighboring property to the south.

Characteristics of these drainage areas are summarized in Table 5. A map depicting proposed drainage areas can be found in Appendix B.

Table 6: Proposed Peak Flows

In an effort to improve the quality of the stormwater discharged from the site, the project will include two hydrodynamic separators up-gradient of both subsurface detention systems and catch basins with two-foot sumps. The site will also feature an oil-grit separator to handle runoff from the building. Additionally, a permanent sediment/stormwater basin has been provided at the 467 Pepper Street exit to collect and prevent untreated stormwater runoff from entering Pepper Street. These stormwater quality measures are intended to provide removal of suspended solids before runoff reaches the on-site wetlands. The catch basins onsite will also be outfitted with permanent silt sacks.

A proposed stormwater conveyance system, consisting of a series of pipes and catch basins, will collect the majority of the runoff from the proposed impervious areas. These areas include the proposed roof, driveways, and outdoor storage areas. The catch basins will include two-foot sumps to provide additional stormwater treatment.

The subsurface detention system is comprised of 48" high Cultec Recharger 902HD stormwater chambers in series. The systems are designed to attenuate peak flows for the 2-, 5-, 10-, 25-, 50-, and 100-year storm events. Stormwater leaves the subsurface detention system via an outlet control structure. The outlet control structure features two outlet orifices. The stormwater system will have 12" of stone below and above the stormwater chambers.

The site also features three stormwater basins, Stormwater Basin 1B, Stormwater Basin 1C and Stormwater Basin 3A. Stormwater Basin 1B is located in the southern most portion of the site and has been designed to accommodate the majority of the stormwater runoff from the site and will also provide water quality volume below the lowest outlet control structure orifice. This stormwater basin will outlet through an outlet control structure into a level lip spreader. It has also been designed to include one (1) foot of freeboard during the 100-year storm.

Stormwater Basin 1C is located in the western portion of the site. It has been designed to accommodate the stormwater runoff from the associated outdoor storage area. It will feature an outlet control structure with type CL top, before out letting to a flared end and level lip spreader. The water will then discharge

into the existing wetlands. The basin has been designed to include one (1) foot of freeboard during the 100-year storm.

Stormwater Basin 3A is located in the eastern portion of the site. It has been designed to accommodate the stormwater runoff from the exit drive on 467 Pepper Street. It will feature a Nyloplast riser outlet control structure, before out letting to a riprap splash pad. The water will then discharge into the existing culvert beneath Pepper Street. The basin has been designed as a permanent sedimentation basin and will be accessible via a paved leak off for maintenance purposes.

STORMWATER CONCLUSION

The proposed development results in an increase in impervious area of approximately 3.57 acres when compared to existing conditions. To manage the increase in runoff associated with the increase in impervious area, the project includes the construction of one subsurface detention system and three stormwater basins. These systems are designed to attenuate the proposed rate of runoff for the 2-, 5-, 10-, 25-, 50- and 100-year storm events to result in an overall peak runoff discharge rate to be less than that of overall existing conditions. See proposed hydrology data Appendix B, to confirm a decrease in peak discharge throughout all drainage areas.

SEPTIC SYSTEM DESIGN

The subsurface sewage disposal systems proposed industrial facilities was designed in accordance with the technical standards established in the "Connecticut Public Health Code; On-site Sewage Disposal Regulations, and Technical Standards for Subsurface Sewage Disposal Systems" published by the Commissioner of Public Health, dated January 2018.

SOIL CHARACTERISTICS

According to the NRCS Soil Survey Geographic database for the State of Connecticut, the site is split into four soil groups; Ridgebury, Leicester and Whitman soils, Sutton fine sandy loam soils, Charlton-Chatfield complex and Canton and Charlton fine sandy loam soils. The project area lies entirely within the Canton and Charlton fine sandy loam area.

Canton and Charlton soils are comprised of approximately 10 to 35 percent of stones and boulders over the surface and have slopes ranging from 3 to 35 percent. Typically, the Charlton soils have a surface layer of very dark grayish brown fine sandy loam about 3 inches thick. The subsoil is dark yellowish brown, yellowish-brown, and light olive brown fine sandy loam 19 inches thick. The substratum is olive gray and light olive gray gravelly loamy sand to a depth of 60 inches or more. Typically, the Charlton soils have a surface layer of very dark brown fine sandy loam about 2 inches thick. The subsoil is 25 inches thick. The upper 15 inches is dark yellowish brown fine sandy loam, and the lower 10 inches is yellowish brown gravelly sandy loam. The sub stratum is light brownish gray gravelly sandy loam to a depth of 60 inches or more. The soil is well drained with intermittent areas of exposed bedrock.

EXISTING SITE CONDITIONS

A site investigation was performed on April 13, 2018 by Solli Engineering and Rich Jackson of the Monroe Health District. The investigation included the digging of three deep test pits labeled TP-101 through TP-103. Approximate locations of the test pits can be seen on the Site Utility Plan (Sheet 2.51) in Appendix D. Soil observations and descriptions for each test pit were recorded by Solli Engineering.

Test Pits TP-101, TP-102, TP-103 were general found to have 7-16 inches of topsoil; overlain with 7 to 20 inches of yellowish brown fine sandy loam; overlain with 64 to 78 inches of Light Olive Brown Gravelly Sandy Loam w/ Cobbles, Friable. No ledge or groundwater was encountered in any of the Test Pits.

Percolation tests were performed on April 13, 2018 by Solli Engineering. The percolation tests were performed adjacent to PT-101 and PT-102. The percolations rates observed in PT-101 and PT-102 were between 1 and 10.1 minutes per inch, and are illustrated on the Site Utility Plan (Sheet 2.51) in Appendix D.

LEACHING SYSTEM DESIGN

The required effective leaching area (ELA) was determined for the proposed primary and reserve leaching areas to serve the existing structure as an office use. Per the Connecticut Public Health Code, an office requires 20 gallons of design flow per day (GPD) for each employee, where one may assume about 1 employee for every 200 square feet (or 0.1 GPD/SF). Therefore the design flow for the proposed office use was calculated from the 1,776 SF floor area at 0.1 GPD/SF, yielding a design flow of 177.6 GPD. With a percolation rate of 1.0-10.0 min/inch, and an application rate of 1.5 GPD/SF, the Effective Leaching Area is calculated to be approximately 118.4 square feet. Minimum Leaching System Spread (MLSS) was not calculated as the depth to the restrictive layer was determined to be greater than 60" in all test pits throughout the proposed septic area.

The proposed subsurface sewage disposal system for the proposed office use includes an H-20 load rated 1,000 gallon septic tank and 40 linear feet of 12"x48" leaching stone and perforated pipe trenching. With an ELA of 3.0 SF/LF of trench 40 LF yields 120 SF of leaching area meeting the required 118.4 minimum. The reserve area is designed with the use of 21 lf of 12"x48" concrete galleries at 5.9 sf of ELA per LF, yielding 123.9 SF of leaching area.

SOIL EROSION AND SEDIMENT CONTROL

The proposed plans for soil erosion and sediment control prepared for this project have been developed in accordance with the Town of Monroe Zoning Regulations, Article XIX, effective date October 1, 1997, as well as the 2002 Connecticut Guidelines for Soil Erosion and Sediment Control, prepared by the Connecticut Council on Soil and Water Conservation in cooperation with the Connecticut Department of Environmental Protection.

The soil erosion and sediment control measures that will be proposed as part of this project include geotextile silt fences, temporary sediment traps, temporary diversion swales, construction entrance, dust control measures, riprap stabilization, and inlet protection for existing and proposed drainage features. The project will also incorporate geotextile silt fence with hay bale backing along to the existing wetlands to further protect the wetlands from sediment or erosion that could occur during construction.

The temporary sediment traps will be excavated to detain sediment-laden runoff from contributing drainage areas located with the project's limits of disturbance. The sediment traps are proposed in the low-lying areas of each contributing drainage area and have been sized to provide a minimum storage volume of 134 cubic yards per acre of drainage area, per 2002 Connecticut Guidelines for Soil Erosion and Sediment Control.

For more detail regarding layout and design of the soil erosion and sediment control measures implemented as part of this project see Soil Erosion & Sediment Control Plan (Sheet 2.31) and Soil Erosion & Sediment Control Notes & Details (Sheet 2.41), in Appendix D.

EARTHWORK ANALYSIS WITHIN REGULATED AREA

The proposed development will have slopes that range from approximately 1.0 percent within the parking area to 30 percent within landscaped areas around the edge of the project site. Elevations will range from a high of approximately 440 feet, along the northern edge of the site to meet grading adjacent to a low of approximate 408 at the edge of the existing wetlands.

The project will require a retaining wall at the rear of the project area, adjacent to the wetland and vernal pool areas. A second retaining wall will be required to accommodate the change in grade through the center access aisle. There will also a 4' boulder wall on the backside of the outdoor storage bins.

Within the regulated area there will be a net fill of 3,046 CY. This is to accommodate the 3:1 slope to reach the higher elevations throughout the center of the site.

SITE UTILITIES

WATER

An existing twelve (12) inch water main within Pepper Street provides water service in front of the subject property. Water will be provided to the proposed building via a two (2) inch ductile iron pipe from the existing water main in Pepper Street, via a wet tap. The existing well on the property will be abandoned in place per the health department's requirements. An additional two (2) inch ductile iron pipe will come from the main building and provide service to the processing building to the south. Each of the outdoor storage bins will feature a dust control sprinkler which will be fed water supply from the proposed water lateral as shown on Sheet 2.51.

TELEPHONE AND ELECTRIC

Existing telephone and electrical services are located within Pepper Street and are provided by Frontier Communications and Eversource Energy, respectively. Existing telecommunication and electrical service exists along Pepper Street via utility poles and overhead lines. Proposed telecommunication and electrical service will be pulled from an existing utility pole (SBC 2145) located approximately 100 feet south from the proposed site drive. Refer to the Site Utility Plan, in Appendix D, for more detail regarding the layout of the proposed site utilities.

GAS

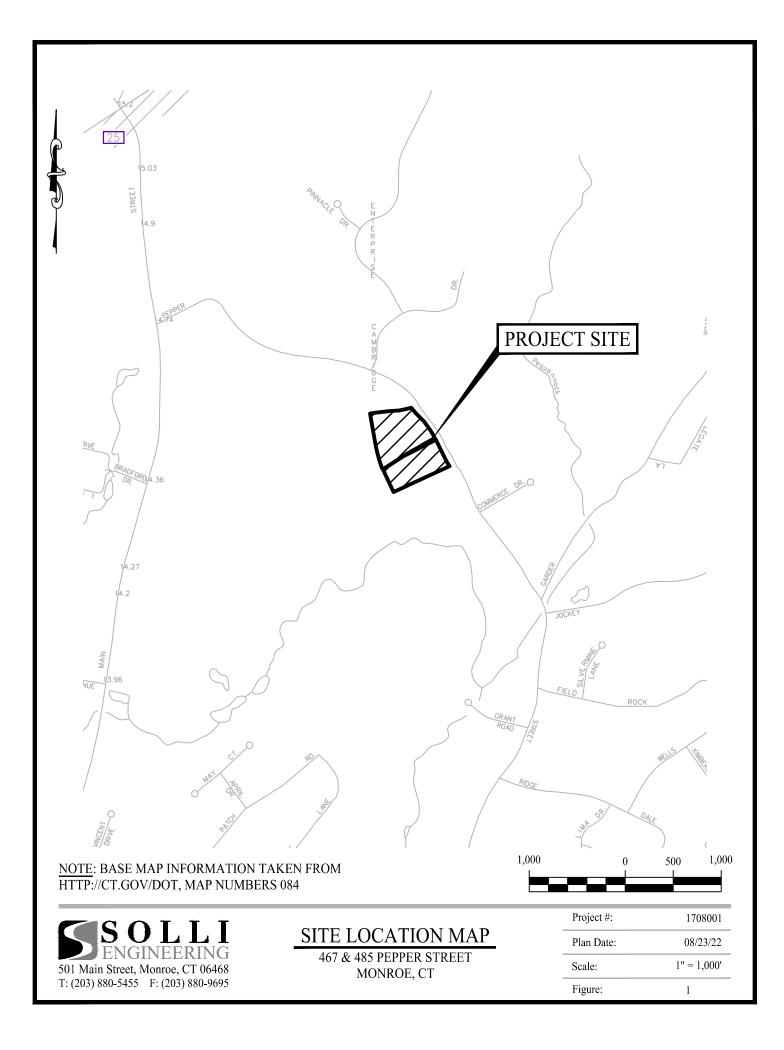

The project proposes to maintain the existing propane tanks and pipe configuration, located behind the existing building. This setup will continue to provide gas to the proposed facility.

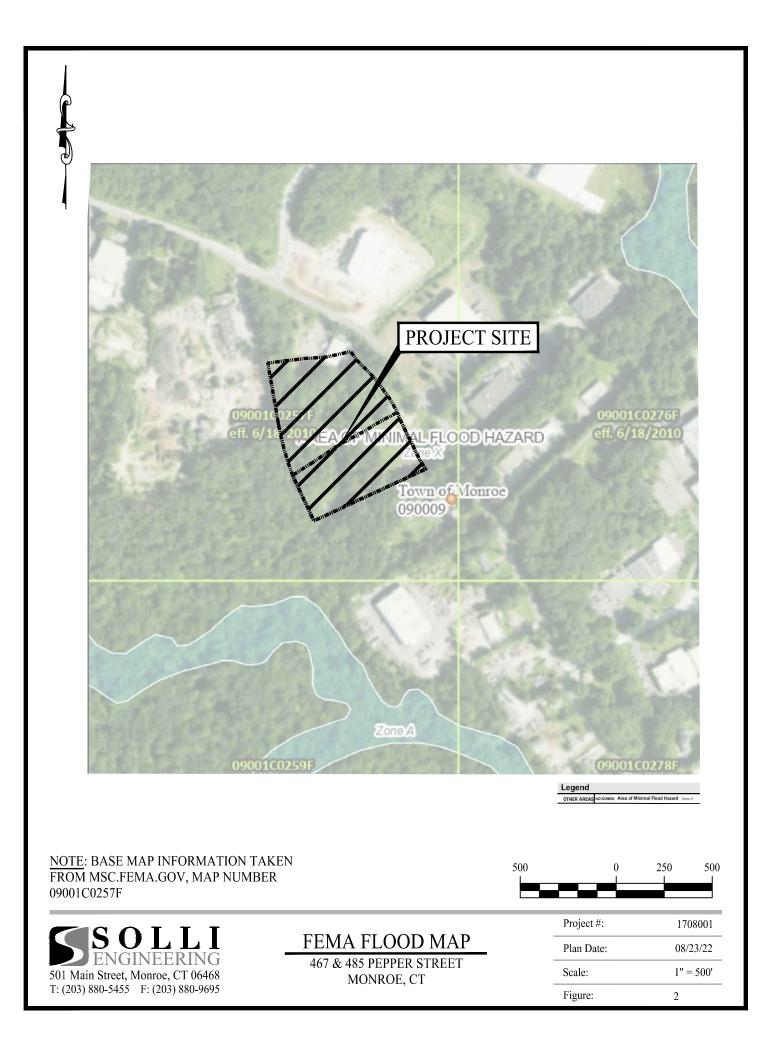

Intersection Sight Distance

Intersection sight distance (ISD) at the proposed site driveways were reviewed and evaluated per guidance provided in the 2003 edition of the CTDOT Highway Design Manual. For passenger cars exiting the site driveways, based on the posted speed limit of 25 miles per hour, a minimum ISD of 280 feet is required looking both directions out of the site driveways. Truck traffic is proposed to exit only from the southeastern site driveway. Based on the posted speed limit of 25 miles per hour, a minimum ISD of 423 feet is require for trucks looking both directions out of the southeastern site driveway. The proposed site driveways have been designed to provide adequate sight distance for vehicles and trucks exiting the site driveways. Intersection sight distance for trucks is illustrated in Figure ISD-1, included in Appendix E of this report. Intersection sight distances for passenger cars are illustrated in Figure ISD-2 and Figure ISD-3 for the northern and southern driveways respectively, included in Appendix E of this report.

¹ Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

¹ Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

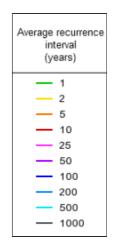

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

OPERATIONS AND MAINTENANCE PLAN

THE PROPERTY OWNER, ITS SUCCESSORS AND ASSIGNS, IS COMMITTED TO MAINTAINING ITS PROPERTY AT 467&485 PEPPER STREET IN ACCORDANCE WITH THIS SITE MAINTENANCE PLAN, AS FOLLOWS, TO MAINTAIN THE AESTHETIC QUALITY AND CLEANLINESS OF THE SITE.

ALL CATCH BASINS ARE TO BE CHECKED AND CLEANED OF TRASH, EXCESSIVE SEDIMENT AND OTHER DEBRIS, BIANNUALLY IN MAY AND NOVEMBER, WITH ADDITIONAL INSPECTIONS AND CLEANING AS NEEDED. ALL PAVED AREAS ARE TO BE CHECKED FOR PERIMETER EROSION, TRASH, SPILLAGE, AND PAVEMENT CONDITIONS DURING THESE INSPECTIONS. THE UNDERGROUND DETENTION SYSTEMS ARE TO BE INSPECTED BI-ANNUALLY DURING THOSE MONTHS AND CLEANED OF EXCESSIVE SEDIMENT AND DEBRIS.

THE HYDRODYNAMIC SEPARATORS ARE TO BE INSPECTED BIANNUALLY AND CLEANED WHEN THE LEVEL OF SEDIMENT HAS REACHED 75% OF CAPACITY IN THE ISOLATED SUMP OR WHEN AN APPRECIABLE LEVEL OF HYDROCARBONS AND TRASH HAS ACCUMULATED. CLEANING OF THE SYSTEM SHOULD BE DONE WITH A VACUUM TRUCK DURING DRY WEATHER CONDITIONS WHEN NO FLOW IS ENTERING THE SYSTEM.

DUST SUPPRESSION SYSTEM(S) ASSOCIATED WITH OPERATIONAL EQUIPMENT, SUCH AS WET METHODS USING SPRAY BARS WITH ATOMIZER NOZZLES WHERE DUST IS GENERATED (I.E. HOPPERS, CONVEYORS, SIEVES, SIZING, OR VIBRATING COMPONENTS) ARE TO BE USED DURING OPERATION. DUST SUPPRESSION SYSTEM(S) ARE TO BE OPERATED AND MAINTAINED IN ACCORDANCE WITH THE MANUFACTURER'S INSTRUCTIONS. IN ADDITION DUST EXPOSURE MITIGATION MEASURES TO; LOCATE NOZZLES UPSTREAM OF DUST GENERATION POINTS: POSITION NOZZLES TO THOROUGHLY WET MATERIAL. ENSURE TH VOLUME AND SIZE OF DROPLETS IS ADEQUATE TO SUFFICIENTLY WET MATERIAL; ENSURE NOZZLES PROVIDE COMPLETE WATER COVERAGE BUT ARE NOT SO FAR THAT THE WATER IS CARRIED AWAY BY WIND, ARE TO BE PRACTICED DURING OPERATION.

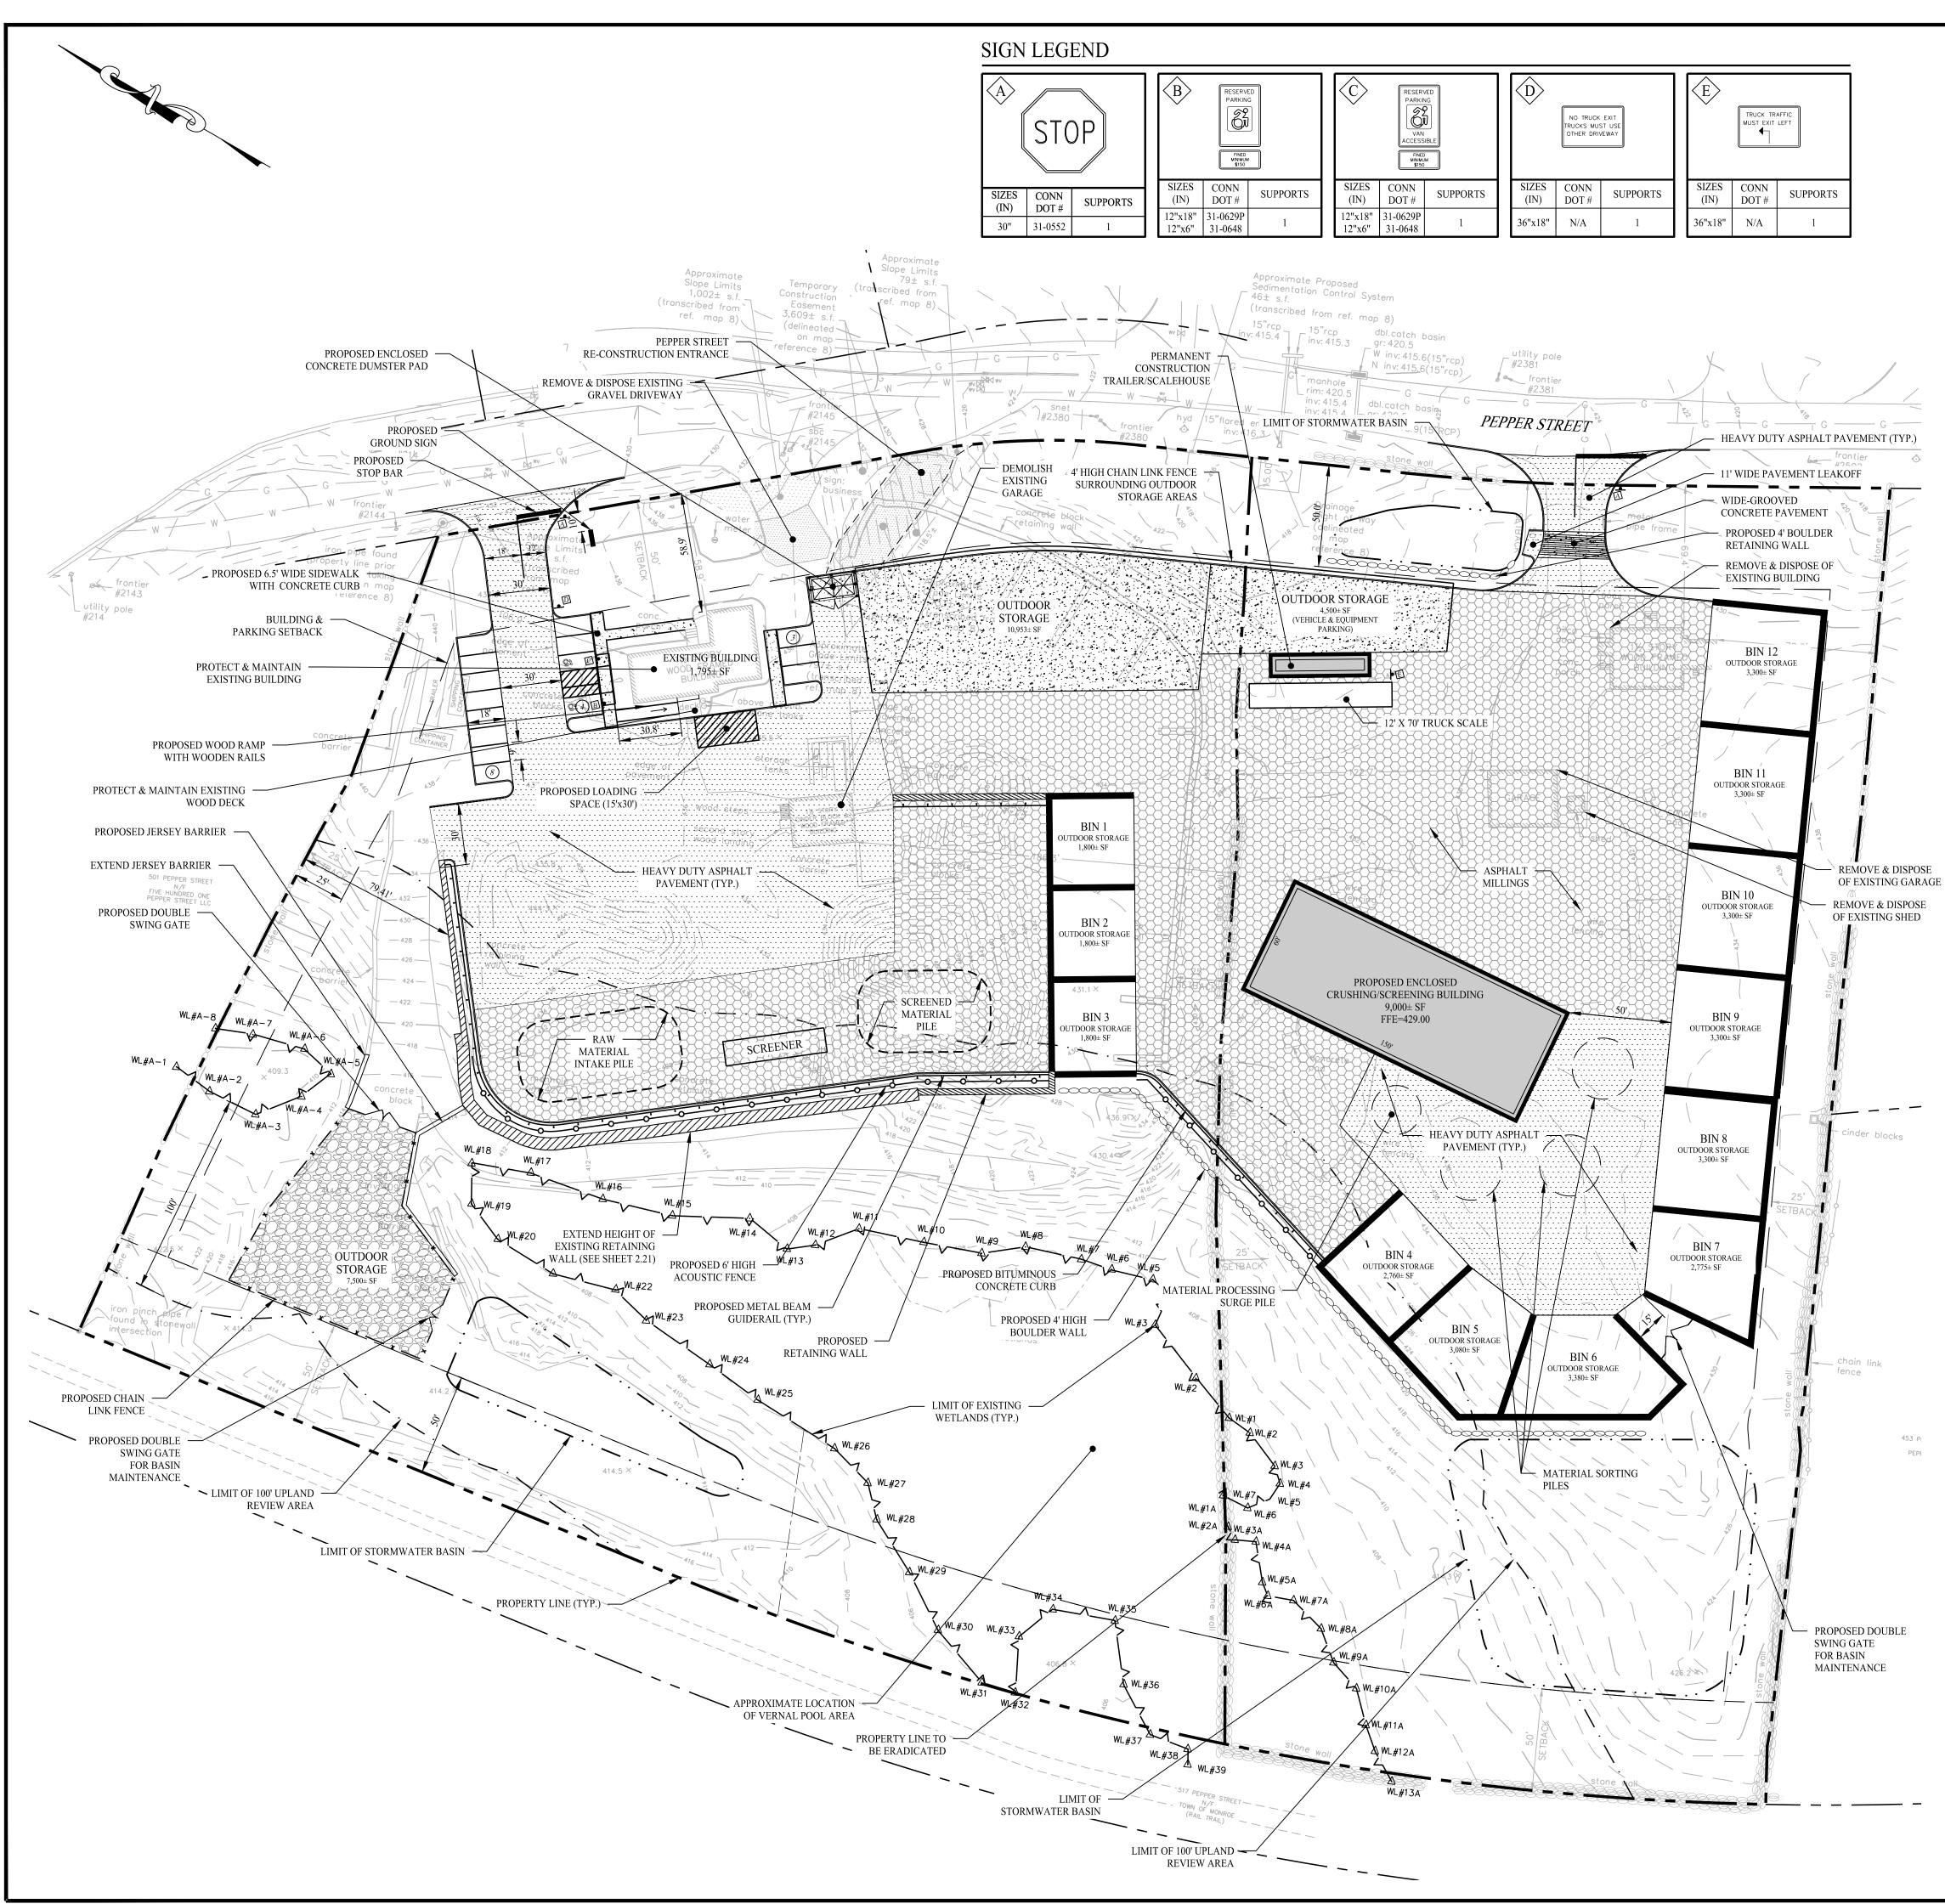

THESE OPERATIONS AND MAINTENANCE NOTES, AS WELL AS THOSE PROVIDED BY THE MANUFACTURER OF THE EQUIPMENT IN USE ARE TO BE POSTED AND MADE AVAILABLE IN THE BUILDING OF OPERATION AT ALL TIMES.

A STREET SWEEPER SHALL REMAIN ON SITE AT ALL TIMES IN ORDER TO REMOVE POTENTIAL SEDIMENT AND DEBRIS FROM PAVED AREAS.

OPERATIONS AND MAINTENANCE PLAN

THE PROPERTY OWNER, ITS SUCCESSORS AND ASSIGNS, IS COMMITTED TO MAINTAINING ITS PROPERTY AT 467&485 PEPPER STREET IN ACCORDANCE WITH THIS SITE MAINTENANCE PLAN, AS FOLLOWS, TO MAINTAIN THE AESTHETIC QUALITY AND CLEANLINESS OF THE SITE.

ALL CATCH BASINS ARE TO BE CHECKED AND CLEANED OF TRASH, EXCESSIVE SEDIMENT AND OTHER DEBRIS, BIANNUALLY IN MAY AND NOVEMBER, WITH ADDITIONAL INSPECTIONS AND CLEANING AS NEEDED. ALL PAVED AREAS ARE TO BE CHECKED FOR PERIMETER EROSION, TRASH, SPILLAGE, AND PAVEMENT CONDITIONS DURING THESE INSPECTIONS. THE UNDERGROUND DETENTION SYSTEMS ARE TO BE INSPECTED BI-ANNUALLY DURING THOSE MONTHS AND CLEANED OF EXCESSIVE SEDIMENT AND DEBRIS.

THE HYDRODYNAMIC SEPARATORS ARE TO BE INSPECTED BIANNUALLY AND CLEANED WHEN THE LEVEL OF SEDIMENT HAS REACHED 75% OF CAPACITY IN THE ISOLATED SUMP OR WHEN AN APPRECIABLE LEVEL OF HYDROCARBONS AND TRASH HAS ACCUMULATED. CLEANING OF THE SYSTEM SHOULD BE DONE WITH A VACUUM TRUCK DURING DRY WEATHER CONDITIONS WHEN NO FLOW IS ENTERING THE SYSTEM.

DUST SUPPRESSION SYSTEM(S) ASSOCIATED WITH OPERATIONAL EQUIPMENT, SUCH AS WET METHODS USING SPRAY BARS WITH ATOMIZER NOZZLES WHERE DUST IS GENERATED (I.E. HOPPERS, CONVEYORS, SIEVES, SIZING, OR VIBRATING COMPONENTS) ARE TO BE USED DURING OPERATION. DUST SUPPRESSION SYSTEM(S) ARE TO BE OPERATED AND MAINTAINED IN ACCORDANCE WITH THE MANUFACTURER'S INSTRUCTIONS. IN ADDITION DUST EXPOSURE MITIGATION MEASURES TO; LOCATE NOZZLES UPSTREAM OF DUST GENERATION POINTS: POSITION NOZZLES TO THOROUGHLY WET MATERIAL. ENSURE TH VOLUME AND SIZE OF DROPLETS IS ADEQUATE TO SUFFICIENTLY WET MATERIAL; ENSURE NOZZLES PROVIDE COMPLETE WATER COVERAGE BUT ARE NOT SO FAR THAT THE WATER IS CARRIED AWAY BY WIND, ARE TO BE PRACTICED DURING OPERATION.

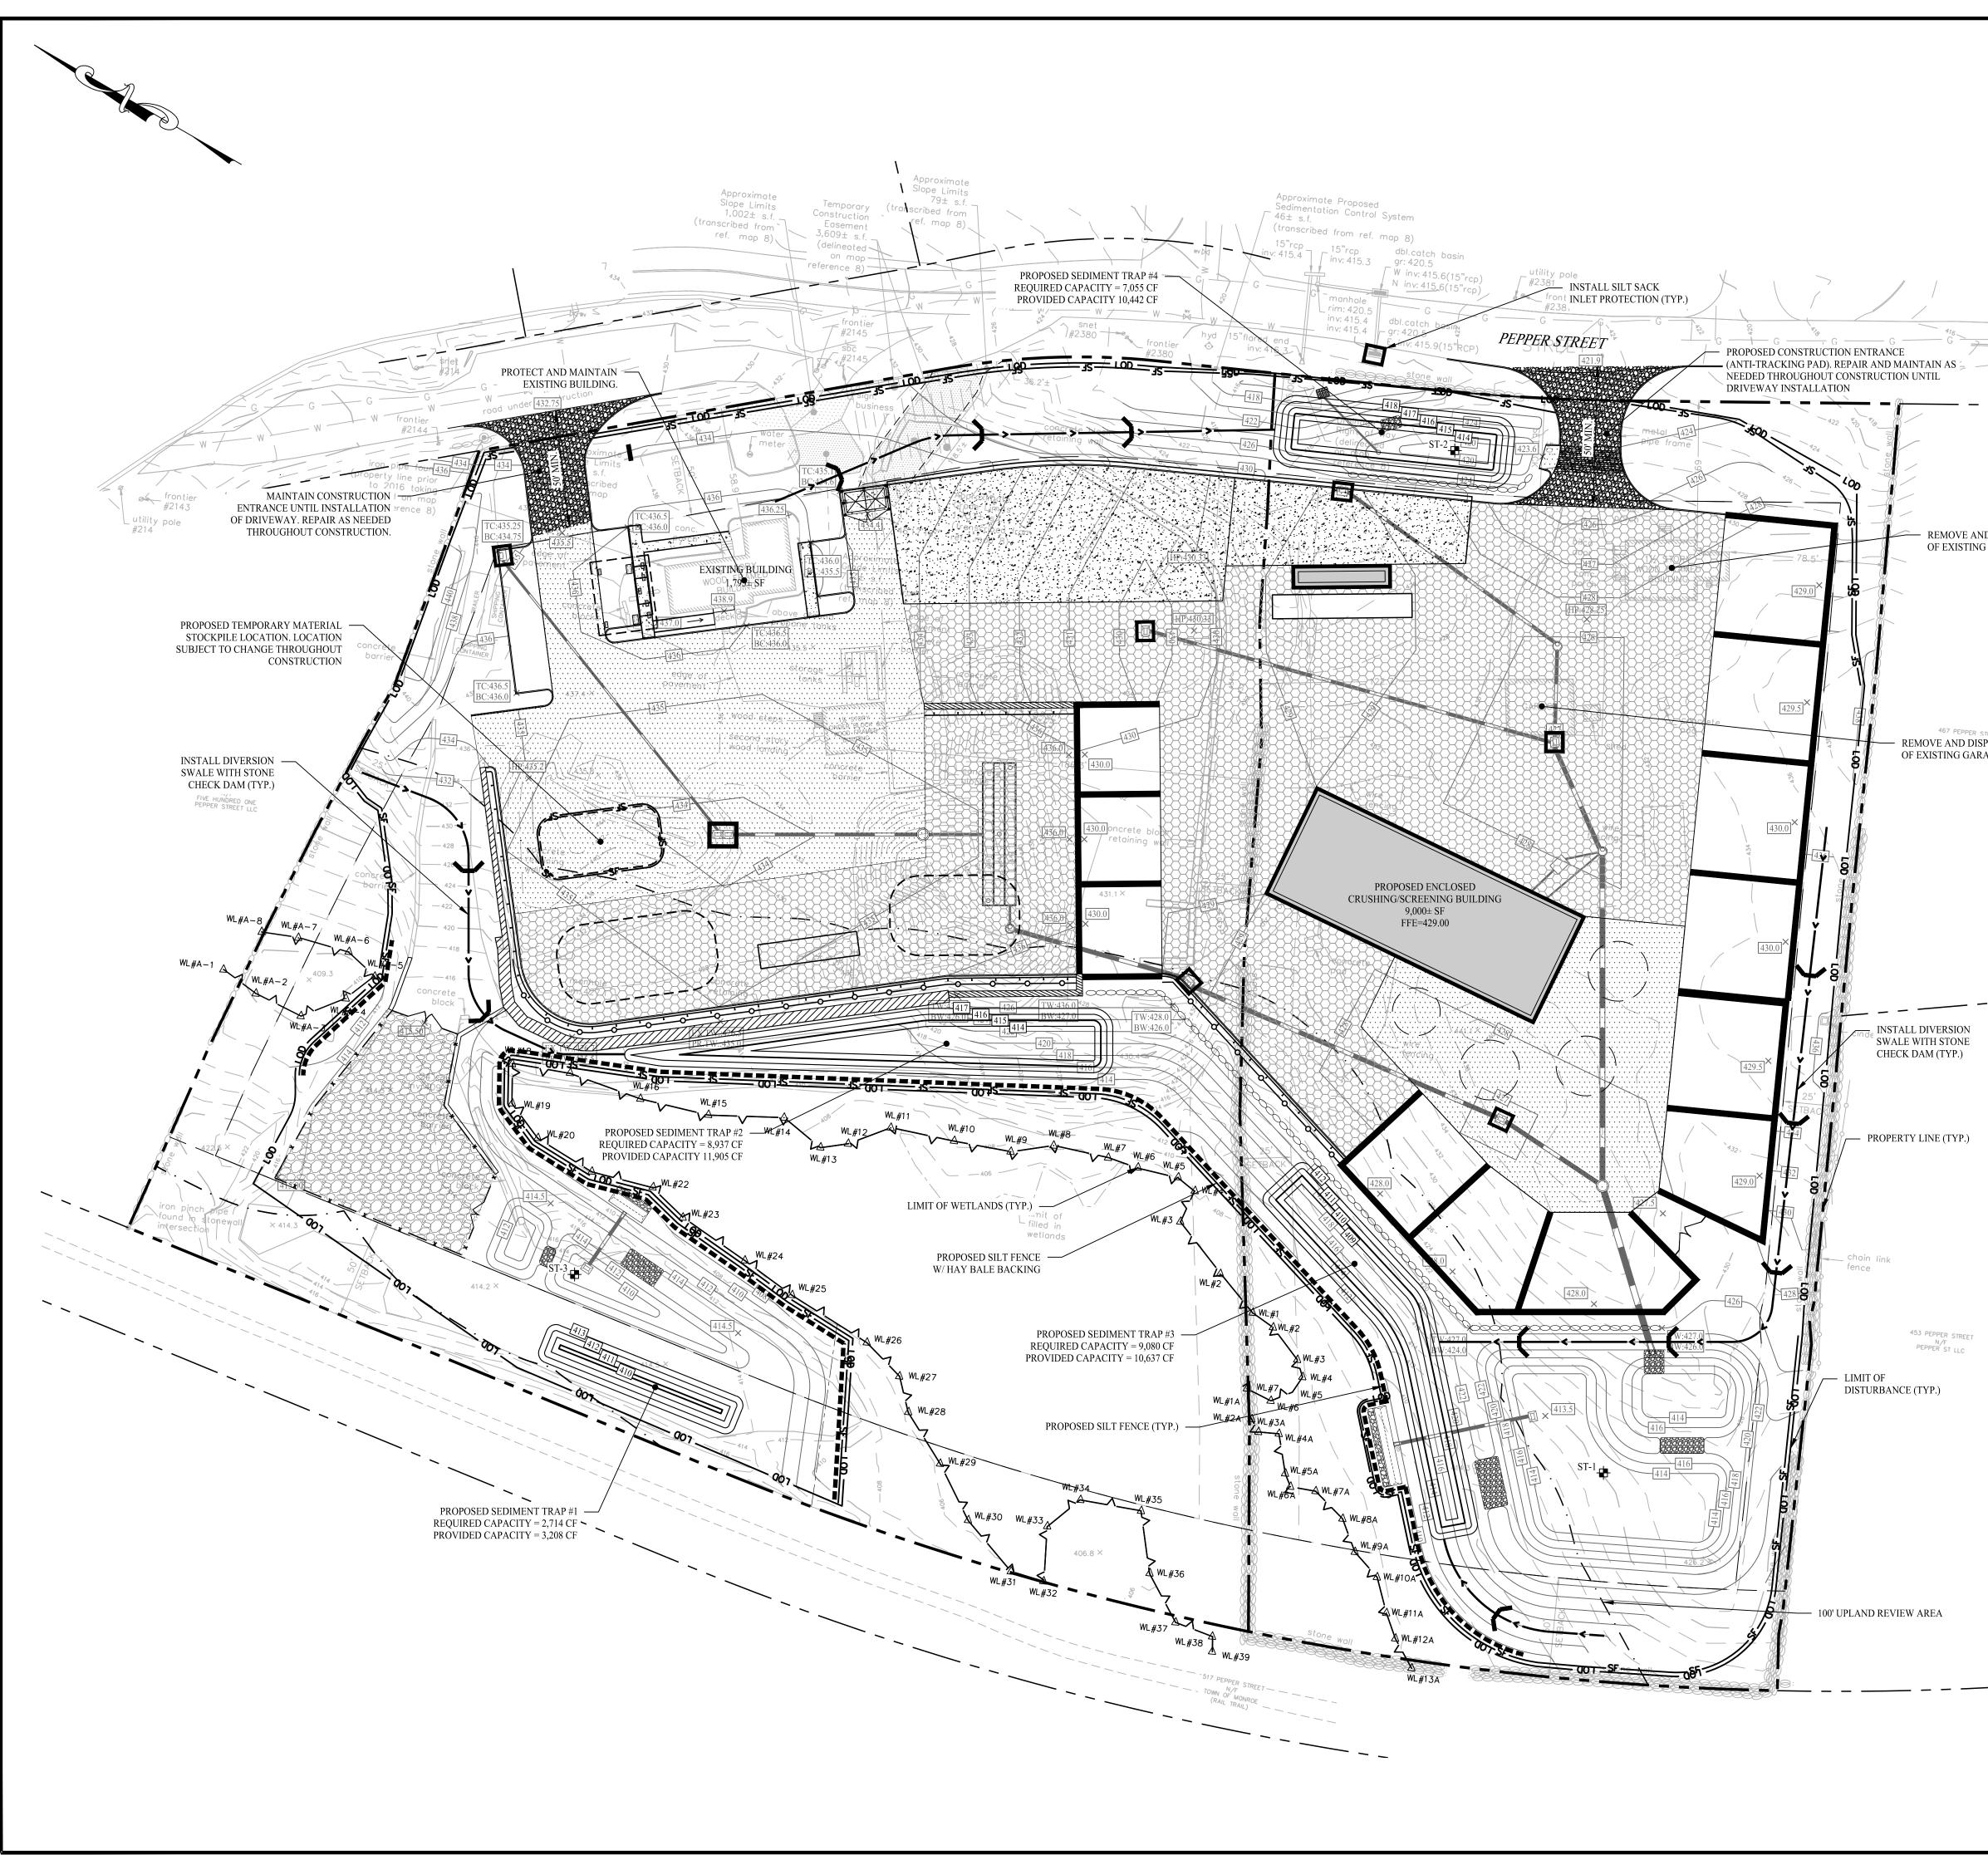

THESE OPERATIONS AND MAINTENANCE NOTES, AS WELL AS THOSE PROVIDED BY THE MANUFACTURER OF THE EQUIPMENT IN USE ARE TO BE POSTED AND MADE AVAILABLE IN THE BUILDING OF OPERATION AT ALL TIMES.

A STREET SWEEPER SHALL REMAIN ON SITE AT ALL TIMES IN ORDER TO REMOVE POTENTIAL SEDIMENT AND DEBRIS FROM PAVED AREAS.

SOIL EROSION AND SEDMIMENT CONTROL GENERAL NOTES

SEDIMENT & EROSION CONTROL NARRATIVE HE SEDIMENT AND EROSION CONTROL PLAN WAS DEVELOPED TO PROTECT THE EXISTING ROADWAY AND STORM DRAINAGE SYSTEMS, ADJACENT PROPERTIES, AND ANY ADJACENT WETLAND AREA AND WATER COURSE FROM SEDIMENT LADEN SURFACE RUNOFF AND EROSION.

CONSTRUCTION SCHEDULE CONSTRUCTION TO BEGIN IN FALL 2022 WITH EXPECTED COMPLETION SUMMER 2023. APPROPRIATE EROSION CONTROL MEASURES AS DESCRIBED HEREIN. SHALL BE INSTALLED BY THE CONTRACTOR PRIOR TO THE COMMENCEMENT OF ALL SITE CLEARING OR CONSTRUCTION ACTIVITY. SCHEDULE WORK TO MINIMIZE THE LENGTH OF TIME THAT BARE SOIL WILL BE EXPOSED.

CONTINGENCY EROSION PLAN THE CONTRACTOR SHALL INSTALL ALL SPECIFIED EROSION CONTROL MEASURES AND WILL BE REOUIRED TO MAINTAIN THEM IN THEIR INTENDED FUNCTIONING CONDITION. THE LAND USE AGENTS OF THE TOWN OF MONROE AND PROJECT ENGINEER SHALL HAVE THE AUTHORITY TO REQUIRE SUPPLEMENTAL MAINTENANCE OR ADDITIONAL MEASURES IF FIELD CONDITIONS ARE ENCOUNTERED BEYOND WHAT WOULD NORMALLY BE ANTICIPATED.

OPERATION REOUIREMENT LEARING AND GRUBBING OPERATIONS:

- ALL SEDIMENTATION AND EROSION CONTROL MEASURES, INCLUDING THE CONSTRUCTION OF TEMPORARY SEDIMENTATION TRAPS AND STONE CONSTRUCTION ENTRANCE ANTI-TRACKING PADS, WILL BE INSTALLED PRIOR TO THE START OF CLEARING AND GRUBBING OPERATIONS.
- FOLLOWING INSTALLATION OF ALL SEDIMENTATION AND EROSION CONTROL MEASURES. THE CONTRACTOR SHALL NOT PROCEED WITH GRADING, FILLING OR OTHER CONSTRUCTION OPERATIONS UNTIL THE ENGINEER HAS INSPECTED AND APPROVED ALL INSTALLATIONS
- 3. THE CONTRACTOR SHALL TAKE EXTREME CARE DURING CLEARING AND GRUBBING OPERATIONS SO AS NOT TO DISTURB UNPROTECTED WETLAND AREAS OR SEDIMENTATION AND EROSION CONTROL DEVICES.
- 4. FOLLOWING THE COMPLETION OF CLEARING AND GRUBBING OPERATIONS, ALL AREAS SHALL BE STABILIZED WITH TOPSOIL AND SEEDING OR PROCESSED AGGREGATE STONE AS SOON AS PRACTICAL. ALL REMOVED INVASIVE PLANT SPECIES MATERIAL SHALL BE FULLY REMOVED FROM THE SITE AND TAKEN TO AN APPROVED AND/OR ACCEPTABLE DISPOSAL LOCATION.
- ROUGH GRADING OPERATIONS: DURING THE REMOVAL AND/OR PLACEMENT OF EARTH AS INDICATED ON THE GRADING PLAN, TOPSOIL SHALL BE STRIPPED AND APPROPRIATELY STOCKPILED FOR REUSE. 2. ALL STOCKPILED TOPSOIL SHALL BE SEEDED, MULCHED WITH HAY, AND ENCLOSED BY A SILTATION FENCE.
- FILLING OPERATIONS 1. PRIOR TO FILLING, ALL SEDIMENTATION AND EROSION CONTROL DEVICES SHALL BE PROPERLY IMPLEMENTED. MAINTAINED AND FULLY INSTALLED, AS DIRECTED BY THE ENGINEER AND AS SHOWN ON THIS PLAN. 2. ALL FILL MATERIAL ADJACENT TO ANY WETLAND AREAS. IF APPLICABLE TO THIS PROJECT, SHALL BE GOOD OUALITY, WITH LESS THAN 5% FINES PASSING THROUGH A #200 SIEVE (BANK RUN), SHALL BE PLACED IN LIFT
- THICKNESS NOT GREATER THAN THAT SPECIFIED IN PROJECT SPECIFICATIONS. LIFTS SHALL BE COMPACTED TO 95% MAX. DRY DENSITY MODIFIED PROCTOR OR AS SPECIFIED IN THE CONTRACT SPECIFICATIONS OR IN THE GEOTECHNICAL REPORT 3. AS GENERAL GRADING OPERATIONS PROGRESS, ANY TEMPORARY DIVERSION DITCHES SHALL BE RAISED OR LOWERED, AS NECESSARY, TO DIVERT SURFACE RUNOFF TO THE SEDIMENT traps.
- PLACEMENT OF DRAINAGE STRUCTURES, UTILITIES, AND ROADWAY CONSTRUCTION OPERATIONS: SILT FENCES SHALL BE INSTALLED AT THE DOWNHILL SIDES OF TEMPORARY SEDIMENT TRAP SLOPES, MUD PUMP DISCHARGES, AND UTILITY TRENCH MATERIAL STOCKPILES. HAY BALES MAY BE USED IF SHOWN ON THE EROSION CONTROL PLANS OR IF DIRECTED BY THE PROJECT ENGINEER.

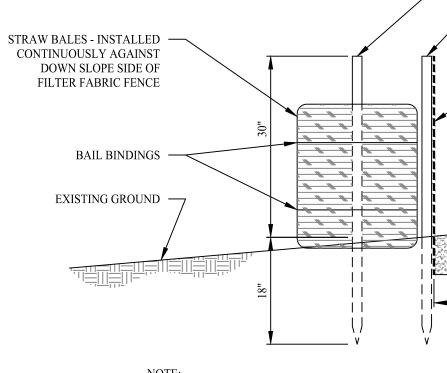

FINAL GRADING AND PAVING OPERATIONS: ALL INLET AND OUTLET PROTECTION SHALL BE PLACED AND MAINTAINED AS SHOWN ON EROSION CONTROL

- PLANS AND DETAILS, AND AS DESCRIBED IN SPECIFICATIONS AND AS DESCRIBED HEREIN. NO CUT OR FILL SLOPES SHALL EXCEED 2:1 EXCEPT WHERE STABILIZED BY ROCK FACED EMBANKMENTS OR EROSION CONTROL BLANKETS, JUTE MESH AND VEGETATION. ALL SLOPES SHALL BE SEEDED, AND ANY ROAD OR DRIVEWAY SHOULDER AND BANKS SHALL BE STABILIZED IMMEDIATELY UPON COMPLETION OF FINAL GRADING UNTIL TURF IS ESTABLISHED.
- 3. PAVEMENT SUB-BASE AND BASE COURSES SHALL BE INSTALLED OVER AREAS TO BE PAVED AS SOON AS FINAL SUB-GRADES ARE ESTABLISHED AND UNDERGROUND UTILITIES AND STORM DRAINAGE SYSTEMS HAVE BEEN INSTALLED. AFTER CONSTRUCTION OF PAVEMENT, TOPSOIL, FINAL SEED, MULCH AND LANDSCAPING, REMOVE ALL
- TEMPORARY EROSION CONTROL DEVICES ONLY AFTER ALL AREAS HAVE BEEN PAVED AND/OR GRASS HAS BEEN WELL ESTABLISHED AND THE SITE HAS BEEN INSPECTED AND APPROVED BY THE TOWN OF MONROE. EASTERN CONNECTICUT SOILS CONSERVATION DISTRICT, TOWN OF MONROE INLAND WETLANDS COMMISSION.

INSTALLATION OF SEDIMENTATION AND EROSION CONTROL MEASURES SILTATION FENCE

- A. DIG A SIX INCH TRENCH ON THE UPHILL SIDE OF THE DESIGNATED FENCE LINE LOCATION. B. POSITION THE POST AT THE BACK OF THE TRENCH (DOWNHILL SIDE), AND HAMMER THE POST AT LEAST 1.5
- FEET INTO THE GROUND. C. LAY THE BOTTOM SIX INCHES OF THE FABRIC INTO THE TRENCH TO PREVENT UNDERMINING BY STORM WATER RUN-OFF.
